Diagnosing malignant neoplasm in a mammal, involves contacting mammalian sample with antibody that binds to human aspartyl beta-hydroxylase polypeptide to form antigen-antibody complex and detecting the complex.

Disclosure; Page 5; 76pp; English.

The present sequence represents a human aspartyl (asparaginyl) beta-hydroxylase (HAAH) enzyme. Epidermal growth factor (EGF)-like domains of polypeptides are hydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malignant neoplasm in a mammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex forming conditions, and detecting the antigen-antibody complex. The method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CNS)-derived body fluid, blood, serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal, where the neoplasm is derived from endodermal tissue and is selected from colon cancer, breast cancer, pancreatic cancer, liver cancer of

The invention relates to diagnosing a neoplasm and inhibiting tumour growth in a mammal, using an antibody that binds to human aspartyl (asparaginyl) beta-hydroxylase (HAAH). Diagnosing a neoplasm comprises contacting a tissue with a detectably-labelled antibody where an increase in level of antibody binding at tissue site compared to the level of binding to normal non-neoplastic tissue indicates the presence of a neoplasm at the tissue site. Inhibiting tumour growth in mammal involves administering the antibody conjugated as cyctoxic agent to a mammal. Also included are a method of conferring an immune response to a tumour cell in a mammal, by administering the antibody, a method of inducing an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HAAH-specific immune response in a mammal, by administering to the mammal an HAAH polypeptide (or a polymucleotide composition encoding the polypeptide, or its degenerate variant), a fragment of HAAH comprising an extracellular domain and lacking a cytoplasmic domain of HAAH, an antibody or its fragment which binds to HAAH (where the antibody is FBSO, 86A, SC7 or 198), a hybridoma cell line chosen from hybridoma FBSO, HA386A, HA15CA and HA219B, and a fragment of HAAH which lacks enzymatic activity or alpha-ketoglutarate binding domain and epidermal growth

factor (EGF)-like domain. The methods are useful for diagnosing neoplasm in a mammal, inhibiting tumour growth in a mammal, conferring an immune response to a brain tumour cell (e.g. glioma, glioblastoma, astrocytoma or haemangioma) in a mammal, for conferring immune response to a pancreatic carcinoma cell and for inducing a HAAH-specific immune response in a mammal. The method is useful for diagnosing malignant neoplasms for mendodermal tissue, e.g. colon cancer, breast cancer, pancreatic cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of central nervous system (CNS) e.g. primary malignant CNS neoplasms of both neuronal and glial cell origin and metastatic CNS neoplasms, and for diagnosing brain present sequence represents human HAAH

The present invention relates to a method for inhibiting tumour growth in a mammal. The method comprises administering to the mammal a compound, which inhibits the expression or enzymatic activity of a human aspartyl (asparaginyl) beta-hydroxylase (HAAH). The compound may inhibit HAAH hydroxylation of a NOTCH polypeptide. In particular, the compound may inhibit hydroxylation of an epidermal growth factor (EGF) like repeat sequence in a NOTCH polypeptide. The methods are useful for inhibiting tumour growth or killing tumour cells, or for diagnosing or prognosticating a malignant neoplasm. In particular, the tumour or neoplasm is colon cancer, breast cancer, pancreatic cancer, liver cancer, cancer of the bile ducts, or cancer or tumour of the central nervous system (CNS). The present sequence represents HAAH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121 PEEAEPHTEPEEQVPVEAEPQNIEDEAKEQIQSLLHEMVHAEHVEGEDLQQEDGPTGEPQ 180

The present invention relates to the isolation of human protein

modification and maintenance molecules (PMMM), and the polynucleotide

sequences encoding them. A total of 40 PMMM polypeptides (designated PMMM

-1 to PMMM-40) are disclosed. The sequences of the invention are useful

for diagnosing a condition or disease associated with the expression of

PMMM in a subject, preparing a polyclonal or monoclonal antibody, and

generating an expression profile of a sample containing the

polynucleotides. The diseases or conditions associated with decreased

expression or overexpression of PMMM are cell proliferation disorders

(e.g. cancer, atherosclerosis), neurological disorders (e.g. epilepsy,

Huntington's disease, stroke), immune/inflammatory disorders, (e.g. AIDS,

allergies), developmental disorders (e.g. hypothyroidism, Cushing's syndrome), gastrointestinal or epithelial disorders, and infections. The

PMMM polypeptides or their fragments are useful in screening compounds

con effectiveness as agonists or anteagonists of the polypeptide.

caltering the expression of the target polymcideide and compounds that

caltering the expression of the target polymcideide and compounds to specifically bind to, or modulate the activity of the polypeptide.

ABU92021-ABU92000 represent the human PMMM polypeptides of the invention

This invention describes a novel polymucleotide and polypeptide sequence for the antigen detected by the antibody MCA 44-346. This antigen is designated Labyrinthin (Lab). Antibodies directed to the Labyrinthin (Lab). Protein are useful for the detection of Lab. The Lab protein is useful in diagnostic assays for cancer, e.g. to monitor the presence and amount of antibodies (this method is especially useful for cancer cells that have the Lab marker). As the Lab gene is not tissue-specific, it will detect cancer regardlass of which organ it occurs in. Peptides derived from Lab are used in the preparation of vaccines to prevent human cancer and/or to treat humans with cancer. Antibody MCA 44-346 is able to differentiate antigen detected by this antibody has not been elucidated in the prior art. Determination of the polypeptide and polymucleotide sequence of this antigen would enhance its usefulness in cancer diagnosis, treatment and prevention. The present invention discloses the sequence of the antigen recognized by the MCA 44-346 antibody. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      178

The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polymorleotide is useful for treating a lung cancer in a patient. The polymorleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This is the amino acid sequence of a lung tumour associated protein. This jactent did not form part of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a polymucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence (S2) mentioned in specification, complement of S1, sequences consisting of at least 20 contiguous residues of S1, sequences that hybridise to S1, sequences having 75%, preferably 90%, identity to S1, or degenerate variants of S1. Also included are an isolated polypeptide (comprising a sequence (S3) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence cooded by the polymucleotide, or sequences having at least 70%, or preferably 90%, identity to a sequence encoded by the polymucleotide, or sequence encoded by the polymucleotide, or sequence cocded by the polymucleotide operably linked to an expression control sequence, a host cell transformed or transfected with the varies of a cancer specifically binds to the polypeptide, detecting the presence of a cancer in a patient, a fusion protein comprising the polypeptide, an oligonucleotide that hybridises to S1 under moderately stringent conditions, stimulating and/or expanding T cells specific for a tumour

protein (comprising contacting T cells with the polymucleotide, protein or antigen-presenting cells, under conditions and for a time sufficient to permit the stimulation and/or expansion of T cells) and inhibiting the development of a cancer in a patient (by incubating CD4 + and/or CD8 + T cells isolated from a patient with the polymucleotide, protein or antigen presenting cells that express the polymucleotide, protein or antigen proliferate, administering to the patient an effective amount of the proliferate, administering to the patient an effective amount of the proliferated T cells, and thus inhibiting the development of a cancer in composition for stimulating an immune response in a patient, and for treating a cancer in a patient (particularly lung cancer). The colymucleotide is useful for determining the presence of a cancer in a coligonucleotide is useful in pharmaceutical compositions, e.g. vaccines. The polymucleotide is also useful as a probe composition of rudcleic acid hybridisation, and in the design and proteins in tumour cells. An amplified portion of tumour polymentectide is useful for isolating a full-length gene from a suitable library. The present sequence is a protein encoded by a cDNA (full clibrary. The present sequence is a protein encoded by a cDNA (full clibrary. The present sequence is a protein encoded by a cDNA (full clibrary. The present sequence is a protein encoded by a cDNA (full clorm part of the printed specification, but was obtained in electronic form a tarter of the printed specification, but was obtained in electronic sequence.

                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polypeptide associated with the compositions and methods for the therapy and diagnosis of lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Lu DAM;

Novel human oxidoreductase protein (ORP) useful for diagnosing, treating and preventing cell proliferative, neurological, viral, reproductive and autoimmune/inflammatory disorders associated with abnormal expression of

Claim 1; Page 110-111; 136pp; English.

Sequences AAB73668-AAB73694 represent 27 novel human oxidoreductase proteins, designated ORP-1 to ORP-27 respectively, and sequences AAB7223 represent CDNAs encoding ORP-1 to ORP-27. Human ORP proteins and nucleic acids are useful for diagnosing, treating or preventing cell proliferative disorders (e.g. arteriosclerosis, cirrhosis, psoriasis, cancers); endocrine disorders (e.g., type I or II diabetes mellitus, diabetes insipidus, dwarfism, hirsutism, amenorrhoea, osteoporosis); metabolic disorders (e.g., obesity, phenylketonuria, osteoporosis); metabolic disorders (e.g., obesity, phenylketonuria, ovulatory and menstrual cycle defects, endometriosis, polycystic ovary disorders (e.g., epilepsy, stroke, Alzheimer's disease, Huntington's disorders (e.g., epilepsy, stroke, Alzheimer's disease, Huntington's disease, parkinson's disease, meningitis, Creutzfeldt-Jakob disease, cerebral palsy, muscular dystrophy, mood, anxiety and schizophrenic disorders); viral, bacterial, fungal and parasitic infections; and autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome (AIDS), allegajes, asthma, Crohn's disease, atopic dermatitis, counting multiple sclerosis, rheumatoid arthritis or ulcerative colitie. Human ORP proteins and nucleotides can be used to identify compounds which modulate their activity or expression. ORP nucleic acid sequences may also be used for assessing the toxicity of a test compound, to detect upstream sequences such as promoters and regulatory elements, and to create knock out or knock in animals or transgenic animals to model human

(CURA-) CURAGEN CORP.

```
disease. Oligonucleotide primers derived from ORP gene sequences may be used to detect single nucleotide polymorphisms (SNPs) and for mapping the naturally occurring genomic sequences. Antibodise specific for ORP proteins may be used in the diagnosis of disorders associated with aberrant ORP expression, in assays to monitor patients being treated with ORP or modulators thereof, and for assessing toxicity of potential drugs
                                                                                                                                                                                                                                                                                                                                    125 KLYHNLQEYAKR----YSWSGMGRIHKGIREQGRYLNSRPSIQKPEVFFLPDLPTTPY 178

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic, vulnerary; antiporvatic, antiparkinsonian; noctropic; neuroprotective; osteopathic; antiporvulsant; antiparkinsonian; noctropic; neuroprotective; osteopathic; cardiant; thrombolytic; coaquiant; vasotropic; antidabetic; hypotensive; cardiant; thrombolytic; cagulant; vasotropic; antidabetic; hypotensive; antiviral; antitheredian; antitheredian; antitheredian; cardiant; numinosuppressive; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative used to treat cancers, proliferative disorders, cardiovascular disease, disorders, osteoarthritis, graff vs host disease, cardiovascular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency contracts.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of F. Luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. Luminescens and are able to alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        response or sensitivity to toxins and antibiotics produced by P. Imminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful the rapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           533 DAMQRVGNKEAYKWYELGHKRGHFASVWQRSLYNVNGLKAQPWW-TPKETGYTELVKSLE 591

as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used

J. Biol. Chem. 274:28660-28668(1999).
-!- FUNCTION: May be involved in anchoring calsequestrin to the junctional sarcoplasmic reticulum and allowing its functional coupling with the ryanddine receptor (By similarity).
-!- SUBCELLULAR LOCATION: Type II membrane protein. Sarcoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                F -> EPIKĞKEVKVPGSLKEKE (in isoform

```

```
filaments). Stimulates actin binding of tropomyosin and actin filaments). Stimulates actin binding of tropomyosin which increases the stabilization of actin filament structure. In muscle tissues, inhibits the actomyosin Afrase by binding to F-actin. This inhibition is attenuated by calcium-calmodulin and is potentiated by tropomyosin. Interacts with actin, myosin, two molecules of tropomyosin and with calmodulin. Also play an essential role during callular mitosis and receptor capping. SUBCELLULAR LOCATION: On thin filaments in smooth muscle and on stress fibers in filaroblasts (nonmuscle) (By similarity).

ALTERNATIVE PRODUCTS:
Event=Alternative splicing; Named isoforms=3;

Name=Gizzard h-cad; IsoId=P12957-1; Sequence=Displayed;

IsoId=P12957-2; Sequence=VSP_004152, VSP_004153; Name=Gizzard 1-cad; Name=Brain 1-cad;

Isoid=P12957-3; Sequence=VSP_004153; TISSIB SPECIFICITY: High-molecular-weight caldesmon (h-caldesmon) is predominantly expressed in smooth muscles, whereas low-molecular-weight caldesmon (l-caldesmon) is widely distributed in non-muscle tissues and cells. Not expressed in skeletal muscle or

DOMAIN: The N-terminal part seems to be a myosin/calmodulin-binding domain, and the C-terminal a tropomyosin/actin/calmodulin-binding domain. These two domains are separated by a central helical region in the muscle forms.

PTM: Phosphorylated in non-muscle cells. Phosphorylation by Cdc2 during mitosis causes caldesmon to dissociate from microfilaments. Phosphorylation reduces caldesmon binding to actin, myosin, and calmodulin as well as its inhibition of actomyosin ArPase activity. Phosphorylation also occurs in both quiescent and dividing smooth muscle cells with similar effects on the interaction with actin and calmodulin and on microfilaments reorganization (By similarity). SIMILARITY: Belongs to the caldesmon family.

Eur. J. Blochem. 233:258-265(1995).

-!- FUNCTION: May be involved in anchoring calsequestrin to the junctional sarcoplasmic reticulum and allowing its functional coupling with the ryanodine receptor (By similarity).

-!- SUBUNIT: Homooligomer of variable subunit number; disulfide-linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE=Skeletal muscle;

                                                                                                                                                                           FUNCTION: Neurofilaments usually contain three intermediate filament proteins: L, M, and H which are involved in the maintenance of neuronal caliber.

PTM: There are a number of repeats of the tripeptide K-S-P, NFM is phosphorylated on a number of the serines in this motif. It is thought that phosphorylation of NFM results in the formation of interfilament cross bridges that are important in the maintenance
                                                                                                                                                                                                                                                                                                PTM: Phosphorylation seems to play a major role in the functioning of the larger neurofilament polypeptides (NF-M and NF-H), the levels of phosphorylation being altered developmentally and coincident with a change in the neurofilament function. SIMILARITY: Belongs to the intermediate filament family.
                                                                                                                     "Glycosylation of mammalian neurofilaments. Localization of multiple

"The translocation t(8;16)(p11;p13) of acute myeloid leukaemia fuses
a putative acetyltransferase to the CREB-binding protein.";
Nat. Genet. 14:33-41(1996).

-i- FUNCTION: May represent a chromatin-associated acetyltransferase.
-i- SUBCELLULAR LOCATION: Nuclear.
